Summary

MetaHate is a comprehensive meta-collection comprising 1,226,202 social media posts aggregated from 36 distinct hate speech datasets. Each entry includes the post content and a binary label indicating the presence (1) or absence (0) of hate speech. This dataset aims to unify various efforts in hate speech detection by providing a consolidated resource for researchers.

What We Offer

- **Extensive Collection:** A large-scale dataset combining multiple sources to facilitate diverse research in hate speech detection.
- **Standardized Format:** Data is provided in a TSV (Tab-Separated Values) format with clear labelling for ease of use.
- **Access Options:** Availability of both the complete meta-collection and subsets, depending on user agreements.

Key Features

- **Diverse Data Sources:** Integration of 36 datasets encompassing various forms of hate speech across different social media platforms.
- **Binary Classification Labels:** Each post is labeled as '0' for non-hate speech or '1' for hate speech, simplifying classification tasks.
- **Research-Oriented:** Designed to support and enhance computational linguistic approaches in identifying and understanding hate speech.

Collaboration Objectives

MetaHate project seeks to:

- Unify various hate speech detection efforts by providing a consolidated dataset.
- Facilitate research in computational linguistics and social media analysis.
- Encourage collaboration among researchers to develop robust models for hate speech detection.
